

TCS Biosciences Ltd recognises its responsibilities under Regulation (EU) 2025/40 on Packaging and Packaging Waste (PPWR), which applies to packaging placed on the European Union market.

We are committed to supporting the objectives of the PPWR by working to:

- Minimise packaging weight and volume while maintaining product quality, safety and integrity.
- Improve the recyclability of our packaging wherever technically and commercially practicable.
- Reduce unnecessary packaging and promote the responsible use of materials.
- Review the use of recycled content where this is compatible with applicable quality, hygiene, transport and product-protection requirements.
- Obtain relevant packaging information and documentation from our suppliers.
- Maintain appropriate packaging records and support applicable labelling, traceability and extended producer responsibility requirements.
- Monitor regulatory developments and progressively review our packaging portfolio as further PPWR requirements are introduced.

As a supplier of laboratory reagents, microbiological products and biological materials, some TCS Biosciences products require specialised packaging to protect their sterility, stability, temperature conditions and safe transportation. Where specific packaging is necessary for regulatory, quality or safety reasons, we aim to select the most resource-efficient solution that continues to provide the required level of product protection.

TCS Biosciences is reviewing packaging associated with products supplied to the EU and will continue working with manufacturers, packaging suppliers, distributors and waste-management partners to support compliance throughout the supply chain.
